

Microsoft Teams Troubleshooting and Support Guide

Article ID: KB008

Title: Microsoft Teams Troubleshooting and Support Guide

Category: Collaboration

Subcategory: Microsoft Teams

Assignment Group: Collaboration Support

Priority: P3

Source Type: Enterprise Knowledge Article

Last Reviewed: October 2026

1. Overview

Microsoft Teams is used by employees for corporate chat, meetings, voice and video calls, file collaboration, notifications, and team communication.

This article provides approved troubleshooting guidance for common Microsoft Teams problems, including:

- Microsoft Teams repeatedly asking for sign-in
- Teams sign-in failures
- Password or credential prompts
- Teams not synchronizing messages
- Messages not appearing or updating
- Teams showing offline status
- Chat problems
- Meeting and call connectivity problems
- Microphone and camera problems
- Notifications not appearing
- Teams application freezing or becoming unresponsive
- Slow Teams performance
- Teams cache-related problems
- Teams connectivity problems

Employees should follow the troubleshooting steps in the order provided. If the issue continues after the approved troubleshooting steps, the request should be escalated to the Collaboration Support team.

2. Microsoft Teams Repeatedly Asking for Sign-In

Symptoms

An employee may experience one or more of the following:

- Microsoft Teams repeatedly asks for credentials.
- Teams returns to the sign-in screen after successful authentication.
- Teams appears to be stuck in a sign-in loop.
- The employee can sign in to other corporate applications but Teams continues requesting authentication.
- Teams signs out unexpectedly.

Troubleshooting

First, close Microsoft Teams completely.

After closing the application, restart Microsoft Teams and attempt to sign in again.

If the sign-in prompt continues:

1. Verify that the employee is using the correct corporate account.
2. Confirm that the employee has an active corporate account.
3. Check whether the employee can access other approved corporate services.
4. Restart Microsoft Teams and attempt authentication again.

If the sign-in loop continues after these steps, contact the Collaboration Support team.

Escalation

Escalate when:

- The employee cannot authenticate after restarting Teams.
 - The corporate account may be inactive.
 - Other corporate authentication services are also failing.
 - Repeated authentication prompts continue.
-

3. Microsoft Teams Sign-In Failure

Symptoms

The employee receives an error while attempting to sign in to Microsoft Teams.

Troubleshooting

1. Confirm that the employee is connected to the corporate network or an approved internet connection.
2. Close Microsoft Teams completely.
3. Restart Microsoft Teams.
4. Verify that the employee is using the correct corporate account.
5. Attempt to sign in again.

If authentication continues to fail, verify that the employee's corporate account is active.

Do not request or record the employee's password in the helpdesk ticket.

Escalation

If the employee cannot authenticate after the approved troubleshooting steps, escalate the issue to Collaboration Support or Identity and Access Management as appropriate.

4. Teams Password or Credential Prompt

Symptoms

Teams repeatedly requests credentials even though the employee believes the password is correct.

Troubleshooting

1. Close Microsoft Teams.
2. Restart the application.
3. Verify that the employee is using the correct corporate account.
4. Attempt authentication again.
5. If the corporate password was recently changed, retry authentication using the current corporate credentials.

If the employee's account is locked or the password has expired, the issue should be handled through the approved Identity and Access Management password-reset or account-unlock workflow.

Important

The helpdesk should never ask an employee to provide their password through chat, email, or a ticket.

5. Teams Messages Not Synchronizing

Symptoms

An employee may report:

- New messages are not appearing.
- Recent conversations are missing.
- Teams shows older messages.
- Chat updates are delayed.
- Messages appear on one device but not another.

Troubleshooting

1. Verify that the employee has a working network connection.
2. Close Microsoft Teams.
3. Restart Microsoft Teams.
4. Check whether the messages synchronize after restarting.
5. Verify whether the issue affects one conversation or multiple conversations.
6. If possible, check whether the employee can access Teams from another approved device.

If messages still do not synchronize, escalate to Collaboration Support.

6. Teams Showing Offline Status

Symptoms

Teams displays an offline or disconnected status even though the employee appears to have network connectivity.

Troubleshooting

1. Verify internet or corporate network connectivity.
2. Check whether other corporate applications can connect normally.

3. Close Microsoft Teams.
4. Restart Teams.
5. Check the Teams status again.

If other applications also have connectivity problems, the issue may be related to the employee's network connection.

If only Teams is affected, escalate to Collaboration Support.

7. Teams Chat Problems

Symptoms

An employee may report that:

- Chat messages cannot be sent.
- Chat messages are delayed.
- A conversation cannot be opened.
- Recent messages are missing.
- The chat interface becomes unresponsive.

Troubleshooting

1. Verify network connectivity.
 2. Restart Microsoft Teams.
 3. Check whether the problem occurs with multiple conversations.
 4. Attempt to access Teams from another approved device if available.
 5. If the issue continues, contact Collaboration Support.
-

8. Teams Meeting Connectivity Problems

Symptoms

An employee may experience:

- Difficulty joining a meeting.
- Meeting connection drops.
- Audio or video becomes unstable.

- Meeting performance becomes slow.
- Teams reports poor network quality.

Troubleshooting

1. Verify network connectivity.
2. If using Wi-Fi, confirm that the connection is stable.
3. Close unnecessary applications that may consume significant network or system resources.
4. Restart Microsoft Teams.
5. Rejoin the meeting.

If the issue continues, record the meeting-related symptoms in the ticket and escalate to Collaboration Support.

9. Teams Microphone Problems

Symptoms

Other meeting participants cannot hear the employee.

Troubleshooting

1. Verify that the correct microphone is selected in Teams.
2. Check whether the microphone is muted.
3. Check the device's microphone permissions.
4. Disconnect and reconnect an external headset if one is being used.
5. Restart Microsoft Teams.
6. Test the microphone again.

If the microphone works in other applications but not in Teams, escalate to Collaboration Support.

10. Teams Camera Problems

Symptoms

Other meeting participants cannot see the employee, or the camera preview is unavailable.

Troubleshooting

1. Verify that the correct camera is selected.
2. Check whether the camera is disabled.
3. Check device camera permissions.
4. Close applications that may already be using the camera.
5. Restart Microsoft Teams.
6. Test the camera again.

If the camera works in other applications but not in Teams, escalate to Collaboration Support.

11. Teams Notifications Not Appearing

Symptoms

An employee does not receive notifications for:

- New chat messages
- Mentions
- Meeting reminders
- Team activity

Troubleshooting

1. Verify that Teams notifications are enabled.
2. Check the notification settings for Teams.
3. Verify that the operating system is not blocking Teams notifications.
4. Restart Microsoft Teams.
5. Check whether notifications work after restarting the application.

If notifications continue to fail, escalate to Collaboration Support.

12. Teams Application Freezing

Symptoms

Teams may:

- Stop responding.

- Become stuck on a screen.
- Freeze while opening a conversation.
- Freeze during a meeting.
- Become unresponsive after extended use.

Troubleshooting

1. Wait briefly to determine whether the application recovers.
2. Close Microsoft Teams completely.
3. Restart Teams.
4. Verify network connectivity.
5. Check whether the issue occurs repeatedly.

If Teams continues to freeze, contact Collaboration Support.

13. Teams Running Slowly

Symptoms

Teams may take a long time to:

- Start
- Open chats
- Load meetings
- Display messages
- Switch between teams

Troubleshooting

1. Close unnecessary applications.
2. Verify network connectivity.
3. Restart Microsoft Teams.
4. Restart the computer if the performance problem continues.
5. Check whether other applications are also running slowly.

If the entire computer is slow, the issue may require End User Computing investigation rather than Collaboration Support.

14. Teams Cache-Related Problems

Teams may sometimes display stale application information or behave unexpectedly after extended use.

Symptoms

Possible symptoms include:

- Old information being displayed.
- Unexpected application behavior.
- Repeated sign-in prompts.
- Application state not updating correctly.

Troubleshooting

First:

1. Close Microsoft Teams completely.
2. Restart Teams.
3. Attempt the operation again.

If the issue continues and the organization has an approved Teams cache-clearing procedure, follow that procedure.

Do not manually delete application files unless the procedure has been approved by IT.

If the issue remains unresolved, escalate to Collaboration Support.

15. Teams Network Connectivity Problems

Symptoms

The employee may report:

- Teams cannot connect.
- Messages are delayed.
- Calls disconnect.
- Meetings have poor connectivity.
- Teams repeatedly switches between connected and disconnected states.

Troubleshooting

1. Verify the employee's network connection.
2. Check whether other websites or corporate applications are accessible.
3. Restart Microsoft Teams.
4. If using Wi-Fi, verify that the Wi-Fi connection is stable.
5. Retry the Teams operation.

If multiple corporate applications are affected, consider escalation to Network Support.

If only Teams is affected, escalate to Collaboration Support.

16. Quick Troubleshooting Decision Guide

Problem	First Action	Possible Support Group
Repeated sign-in prompts	Restart Teams and verify corporate account	Collaboration Support
Sign-in failure	Verify account and network connectivity	Collaboration / IAM
Password expired	Use approved password reset workflow	Identity and Access Management
Account locked	Use approved account unlock workflow	Identity and Access Management
Messages not syncing	Restart Teams and verify network	Collaboration Support
Teams offline	Check network and restart Teams	Collaboration / Network
Chat not working	Restart Teams and verify connectivity	Collaboration Support
Meeting connectivity	Check network and restart Teams	Collaboration Support
Microphone problem	Check microphone selection and permissions	Collaboration Support
Camera problem	Check camera selection and permissions	Collaboration Support
Notifications missing	Check Teams and OS notification settings	Collaboration Support

Problem	First Action	Possible Support Group
Teams freezing	Restart Teams	Collaboration Support
Teams slow	Close unnecessary applications and restart	Collaboration / End User Computing
Network problems across applications	Check network connectivity	Network Support

17. Information to Include in an IT Ticket

When escalating a Microsoft Teams issue, include:

- Employee username or approved employee identifier
- Description of the problem
- Approximate time the problem started
- Whether the problem is continuous or intermittent
- Whether other employees are experiencing the same issue
- Whether the problem affects chat, meetings, calls, sign-in, notifications, or another Teams function
- Troubleshooting steps already attempted
- Any error message shown by Teams
- Whether other corporate applications are working normally

Never include the employee's password or other sensitive authentication credentials in the ticket.

18. When to Escalate

Escalate the issue to the appropriate IT support group when:

- Approved troubleshooting steps do not resolve the problem.
- The employee cannot authenticate.
- The employee's corporate account may be locked or inactive.
- Multiple corporate applications are affected.
- Teams continues to crash or freeze.

- Meeting, audio, or video problems continue after troubleshooting.
 - The issue appears to be related to network infrastructure.
 - The issue affects multiple employees or appears to be widespread.
-

19. Support Ownership

Collaboration Support

Primary owner for Microsoft Teams application, chat, meeting, notification, and application-specific problems.

Identity and Access Management

Responsible for account lockout, password expiration, and authentication-related issues when the problem is associated with the employee's corporate identity.

Network Support

Responsible for network connectivity problems affecting Teams or multiple corporate applications.

End User Computing

Responsible for device-level performance and hardware problems affecting Teams.

20. Automation Eligibility

The following Microsoft Teams troubleshooting actions are **not automatically executed by this knowledge article**.

Potential automation candidates must be evaluated by the IT automation layer and must use an approved action from the organization's automation registry.

For this prototype:

Automation eligible: false

The knowledge article provides **grounded troubleshooting guidance**. If no approved automation is available, the employee should be escalated to the appropriate IT support group.

21. Knowledge Article Summary

For common Microsoft Teams problems:

Identify the symptom → Check connectivity → Restart Teams → Verify account/settings → Retry → Escalate if unresolved.

The appropriate support team depends on the problem:

- Teams-specific problem → Collaboration Support
- Password/account problem → Identity and Access Management
- Broad connectivity problem → Network Support
- Device/performance problem → End User Computing
